
Wombat-Lerderderg National Park

Wombat-Lerderderg National Park (approximately 45,000 hectares), between Daylesford and Bacchus Marsh, will comprise the existing Lerderderg State Park and nearly 25,000 hectares of the Wombat State Forest and other public land. The park is situated within the Countries of the Dja Dja Wurrung, Wadawurrung and Wurundjeri Woi Wurrung peoples.

The park will protect signifcant natural and cultural values while providing a range of opportunities for nature-based outdoor recreation.

It will protect the headwaters of several major rivers and high value habitat for many threatened plant and animal species including the greater glider, brush-tailed phascogale and powerful owl.

Most current recreational activities can continue in the new national park. While most forms of hunting and recreational prospecting will not be permitted, seasonal deer hunting (by stalking) will be able to continue in more than half the park and key prospecting areas will be included in nearby regional parks (where this activity will be permitted).
